

AI Draft – ChatGPT – Lab 3

I served as a study assistant throughout the lab by explaining machine learning and neural network concepts, clarifying assignment requirements, and answering questions about PyTorch implementation. I helped the student understand topics such as forward propagation, backpropagation, gradient descent, activation functions, learning rates, model capacity, dropout, evaluation metrics, and confusion matrices. I also assisted with debugging by explaining error messages, suggesting corrections, and guiding the student through issues related to model architectures, saving and loading model weights, and experiment setup. Rather than completing the assignment, I provided explanations, examples, and guidance so the student could implement, test, verify, and interpret the results independently. My role was to support learning and problem-solving while leaving the coding, experimentation, and final decisions to the student.
